I completed this assignment independently because I prefer learning at my own pace. I work around 30 hours a week at my part-time job while managing college coursework and spending another 40+ hours on AI engineering, data structures and algorithms, programming, AI/ML fundamentals, and mathematics. I usually wake up at 2 a.m. to study without distractions. With this schedule, coordinating meetings, dividing tasks, and waiting for teammates adds unnecessary stress.

I've already completed multiple group projects, including Programming Fundamentals I and II, and honestly, I felt I learned less. Most of my energy went into coordinating with people and meeting deadlines rather than understanding the concepts. I've already worked on group projects this semester, and I don't want to repeat the same experience, especially in SQL, database management, and data engineering, which are directly relevant to my career.

I understand teamwork and communication are essential professional skills, but I'm currently in the learning stage, not the working stage. I need the freedom to slow down when something is difficult and move faster when I understand it, rather than follow someone else's pace. I want to understand SQL deeply, troubleshoot errors myself, and learn beyond simply copying queries from PowerPoint slides.

I'm not avoiding teamwork forever. Right now, my goal is to build a strong technical foundation, finish my degree, and protect my time and mental well-being. For me, genuinely understanding the material matters more than simply completing another group assignment.
